Suvi Sippola, M.D., from Turku University Hospital in Finland, and colleagues assessed postintervention QOL and [patient satisfaction](#) and treatment preference during follow-up of a randomized trial comparing [appendectomy](#) to antibiotics among [patients](#) with acute appendicitis. Overall, 423 patients were available at a median follow-up of seven years: 206 and 217 took antibiotics and underwent appendectomy, respectively.

The researchers found that QOL was similar between the appendectomy and antibiotic groups (median health index value, 1.0 in both groups; 95 percent confidence interval [CI], 0.86 to 1.0; P = 0.96). Satisfaction with the treatment was higher for patients who underwent appendectomy versus
