The COVID-19 pandemic has taken a disproportionate toll on residents and staff at long-term care facilities. A review of data from 36 published studies has linked certain characteristics of facilities to more COVID-19 cases and deaths.

In the review, which is published in the Journal of the American Geriatrics Society, facilities that had a larger number of beds and were located in areas with high COVID-19 prevalence tended to have more COVID-19 cases and deaths.

Also, having more staff members was associated with a higher probability of an outbreak; however, in facilities with known COVID-19 cases, higher staffing was associated with fewer deaths.

"Despite differences across studies in data sources and approach, the research points largely to the same results," said lead author R. Tamara Konetzka, Ph.D., of the University of Chicago. "These results tell us that it is exceedingly difficult to protect nursing home
