Diet quality decreased for US seniors from 2001 to 2018
11 March 2022

From 2001 to 2018, there was a decrease in dietary quality among older adults in the United States, according to a study published online March 11 in *JAMA Network Open*.

Tingxi Long, from Duke Kunshan University in China, and colleagues characterized trends in overall diet quality and key food components and nutrients using 24-hour dietary recall data from 10,837 adults aged 65 years or older in nine National Health and Nutrition Examination Survey cycles from 2001-2002 to 2017-2018.

- The researchers found that from 2001 to 2018, there was a deterioration in overall dietary quality among older adults.
- The mean primary American Heart Association (AHA) 2020 Strategic Impact Goals for diet score decreased by 7.9%, from 19.84 to 18.28.
- The mean secondary AHA score decreased by 8.4%, from 34.75 to 31.83.
- The mean Healthy Eating Index 2015 score decreased by 5.4%, from 47.82 to 45.25.

"Older adults have become the fastest-growing segment of the U.S. population; specific attention should be focused on their diets and on diet-related policy to improve their health," the authors write.
