Study finds majority of healthcare workers accepting of COVID-19 vaccines

24 March 2022, by Kat Dodge

Network—found that nearly 90% of healthcare workers surveyed were vaccine-acceptant, with those serving immigrant communities being more accepting than those who did not. Healthcare workers who reported having at least one concern on vaccination were more common to report that their patients also had misgivings.

Surveyed healthcare workers ranked educational information as most helpful for them and colleagues. Additionally, 50% said patients found that a provider recommending vaccination during an interpersonal encounter was most helpful in making a decision.

"Our research supports that healthcare workers can help guide public health efforts by providing real-time information about attitudes toward vaccines and optimal communication methods," said Christine Thomas, DO, an infectious diseases fellow at the U of M Medical School.

Researchers recommend further studying of the relationship between patient and healthcare worker perspectives on vaccines to better understand how information is shared and affects the vaccine decision-making processes.

Provided by University of Minnesota

Research led by the University of Minnesota, published in Vaccine, has found that the majority of healthcare workers have been accepting of COVID-19 vaccines.

"Healthcare workers are invaluable, serving communities at the critical link between public and individual health, particularly in immigrant communities," said William Stauffer, MD, MSPH, FASTMH, a professor in the U of M Medical School and Center for Global Health and Social Responsibility. "They provide individuals with trustworthy information about vaccines and offer public health agencies insight and guidance for vaccine efforts."
