WHO drops endemic country distinction for monkeypox
18 June 2022

The World Health Organization says it has removed the distinction between endemic and non-endemic countries in its data on monkeypox to better unify the response to the virus.

Until the past few months, monkeypox had generally been confined to Western and Central Africa but is now present in several continents.

"We are removing the distinction between endemic and non-endemic countries, reporting on countries together where possible, to reflect the unified response that is needed," the WHO said in its outbreak situation update dated June 17 but sent to media on Saturday.

Between January 1 and June 15, 2,103 confirmed cases, a probable case and one death have been reported to the WHO in 42 countries, it said.

The Geneva-based UN health agency is due on June 23 to hold an emergency meeting to determine whether to classify the global monkeypox outbreak as a public health emergency of international concern.
