Decision support tool used in the emergency department reduces rates of death or hospitalization after heart failure
7 November 2022

The study comes as hospitals grapple with overcrowding and staffing shortages and suggests that heart failure patients at lower risk of adverse events can be discharged from the emergency department or following a short hospital stay—with rapid follow-up care in place.

"Heart failure places a substantial health burden on patients and increases healthcare utilization and costs," says lead author Dr. Douglas Lee, staff cardiologist at the Peter Munk Cardiac Centre at UHN, Ted Rogers Chair in Heart Function Outcomes at the Ted Rogers Centre for Heart Research (TRCHR), and Senior Scientist at ICES. "We need new approaches to improve the care that we deliver to patients with heart failure who come to the emergency department, and the strategy that we tested may be a step toward achieving this goal."

The validated tool, which was developed using data analytics, helps hospital staff to ascertain whether heart failure patients fall into low-, intermediate-, or high-risk categories, which can then inform the decision to admit a patient to hospital or discharge with follow-up care.

Researchers found that the hospital-based strategy for decision support was associated with:

- A 12% reduction in the rate of all-cause death or cardiovascular hospitalization over 30 days.
- A decrease in the rate death or cardiovascular hospitalization over a 20-month follow-up.
- Fewer than six deaths or all-cause hospitalizations for low-risk and intermediate-risk patients who were discharged from hospital until they could be seen by a doctor in the outpatient clinic.
"It has always been our goal to ensure that we provide the right care, for the right patient, at the right time," says senior author Dr. Heather Ross, Scientific Lead, Ted Rogers Centre for Heart Research, and division head, Cardiology, at the Peter Munk Cardiac Centre at the University Health Network. "This diagnostic tool will have an immense impact, not just on patients and families, but on the whole of the healthcare system."
